science to the max interactive human body: Visualization in Mathematics, Reading and Science Education Linda M. Phillips, Stephen P. Norris, John S. Macnab, 2010-09-02 Science education at school level worldwide faces three perennial problems that have become more pressing of late. These are to a considerable extent interwoven with concerns about the entire school curriculum and its reception by students. The first problem is the increasing intellectual isolation of science from the other subjects in the school curriculum. Science is too often still taught didactically as a collection of pre-determined truths about which there can be no dispute. As a consequence, many students do not feel any "ownership" of these ideas. Most other school subjects do somewhat better in these regards. For example, in language classes, students suggest different interpretations of a text and then debate the relative merits of the cases being put forward. Moreover, ideas that are of use in science are presented to students elsewhere and then re-taught, often using different terminology, in science. For example, algebra is taught in terms of "x, y, z" in mathematics classes, but students are later unable to see the relevance of that to the meaning of the universal gas laws in physics, where "p, v, t" are used. The result is that students are confused and too often alienated, leading to their failure to achieve that "extraction of an education from a scheme of instruction" which Jerome Bruner thought so highly desirable.

science to the max interactive human body: Biomedical Visualisation Paul M. Rea, 2019-07-23 This edited book explores the use of technology to enable us to visualise the life sciences in a more meaningful and engaging way. It will enable those interested in visualisation techniques to gain a better understanding of the applications that can be used in visualisation, imaging and analysis, education, engagement and training. The reader will be able to explore the utilisation of technologies from a number of fields to enable an engaging and meaningful visual representation of the biomedical sciences, with a focus in this volume related to anatomy, and clinically applied scenarios. The first six chapters have an anatomical focus examining digital technologies and applications to enhance education. The first examines the history and development of ultrasound, applications in an educational setting, and as a point-of-care ultrasound at the bedside. The second chapter presents a transferable workflow methodology in creating an interactive educational and training package to enhance understanding of the circadian rhythm. The third chapter reviews tools and technologies, which can be used to enhance off-campus learning, and the current range of visualisation technologies like virtual, augmented and mixed reality systems. Chapter four discusses how scanning methodologies like CT imagery, can make stereoscopic models. The fifth chapter describes a novel way to reconstruct 3D anatomy from imaging datasets and how to build statistical 3D shape models, described in a clinical context and applied to diagnostic disease scoring. The sixth chapter looks at interactive visualisations of atlases in the creation of a virtual resource, for providing next generation interfaces. The seventh and eight chapters discuss neurofeedback for mental health education and interactive visual data analysis (applied to irritable bowel disease) respectively. The final two chapters examine current immersive technologies -virtual and augmented reality, with the last chapter detailing virtual reality in patients with dementia. This book is accessible to a wide range of users from faculty and students, developers and computing experts, the wider public audience. It is hoped this will aid understanding of the variety of technologies which can be used to enhance understanding of clinical conditions using modern day methodologies.

science to the max interactive human body: *Heavenly Bodies* Sigurdson, 2016 Deep and wide study of 2,000 years of Christian thought on the human body Does Christianity scorn our bodies? Friedrich Nietzsche thought so, and many others since him have thought the same. Ola Sigurdson contends, to the contrary, that Christianity -- understood properly -- in fact affirms human embodiment. Presenting his constructive contributions to theology in relation to both historical and contemporary conceptions of the body, Sigurdson begins by investigating the anthropological implications of the doctrine of the incarnation. He then delves into the concept of the gaze and discusses a specifically Christian gaze of faith that focuses on God embodied in Jesus. Finally, he weaves these strands into a contemporary Christian theology of embodiment. Sigurdson's profound engagement with the whole history of Christian life and thought not only elucidates the spectrum of Christian perspectives on the body but also models a way of thinking historically and systematically that other theologians will find stimulating and challenging.

science to the max interactive human body: *Terminal Identity* Scott Bukatman, 1993 Scott Bukatman's *Terminal Identity*--referring to both the site of the termination of the conventional subject and the birth of a new subjectivity constructed at the computer terminal or television screen--puts to rest any lingering doubts of the significance of science fiction in contemporary cultural studies. Demonstrating a comprehensive knowledge, both of the history of science fiction narrative from its earliest origins, and of cultural theory and philosophy, Bukatman redefines the nature of human identity in the Information Age. Drawing on a wide range of contemporary theories of the postmodern--including Fredric Jameson, Donna Haraway, and Jean Baudrillard--Bukatman begins with the proposition that Western culture is suffering a crisis brought on by advanced electronic technologies. Then in a series of chapters richly supported by analyses of literary texts, visual arts, film, video, television, comics, computer games, and graphics, Bukatman takes the reader on an odyssey that traces the postmodern subject from its current crisis, through its close encounters with technology, and finally to new self-recognition. This new virtual subject, as Bukatman defines it, situates the human and the technological as coexistent, codependent, and mutually defining. Synthesizing the most provocative theories of postmodern culture with a truly encyclopedic treatment of the relevant media, this volume sets a new standard in the study of science fiction--a category that itself may be redefined in light of this work. Bukatman not only offers the most detailed map to date of the intellectual terrain of postmodern technology studies--he arrives at new frontiers, providing a propitious launching point for further inquiries into the relationship of electronic technology and culture.
