beckers world of the cell solution: Compound Solutions Susan Craddock, 2017-02-21 Claiming 1.5 million lives in 2015, tuberculosis is the world's most deadly infectious disease. Because of the population it overwhelmingly affects, however, pharmaceutical companies are uninterested in developing better drugs for the disease. *Compound Solutions* examines Product Development Partnerships (PDPs), which arose early in the twenty-first century to develop new drugs and vaccines for infectious diseases in low-income countries. Here, for the first time, is a sustained examination of PDPs: the work they do, the partnerships they form, their mission, and their underlying philosophy of addressing global health needs—with implications that extend well beyond tuberculosis. Focusing on two PDPs for tuberculosis—the Global Alliance for TB Drug Development (TB Alliance) and Aeras (a nonprofit focused on vaccine development)—Susan Craddock argues that PDPs do much more than product development. As innovative sites of humanitarian pharmaceutical production, they are contravening mainstream pharmaceutical production by tying drug and vaccine research to global health needs rather than shareholder demand. In largely untethering the profit incentive from pharmaceutical production, Craddock shows, PDPs exhibit more creative and efficient scientific practices, reshaping regulatory norms and implementing more ethical forms of clinical trials that enhance community engagement and capacity building. An unparalleled, interdisciplinary analysis of PDPs as politically, socially, scientifically, and economically innovative sites of pharmaceutical production, *Compound Solutions* is a must for readers in the fields of public health, science and technology studies, and medical social science.

Markus Becker studies, extends, analytically models, simulates and employs the so called Trickle algorithm in measurements in a Wireless Sensor Network test bed for the service distribution. The obtained results apply to the

beckers world of the cell solution: The Amazing World of IDPs in Human Diseases Simona Maria Monti, Giuseppina De Simone, Emma Langella, 2021-06-15 It is now clearly established that some proteins or protein regions are devoid of any stable secondary and/or tertiary structure under physiological conditions, but still possess fundamental biological functions. These intrinsically disordered proteins (IDPs) or regions (IDRs) have peculiar features due to their plasticity such as the capacity to bind their biological targets with high specificity and low affinity, and the possibility of interaction with numerous partners. A correlation between intrinsic disorder and various human diseases such as cancer, diabetes, amyloidoses and neurodegenerative diseases is now evident, highlighting the great importance of the topic. In this volume, we have collected recent high-quality research about IDPs and human diseases. We have selected nine papers which deal with a wide range of topics, from neurodegenerative disease to cancer, from IDR-mediated interactions to bioinformatics tools, all related to IDP peculiar features. Recent advances in the IDPs/IDRs issue are here presented, contributing to the progress of knowledge of the intrinsic disorder field in human disease.

beckers world of the cell solution: Principles of Wood Science and Technology Franz F.P. Kollmann, Wilfred A.Jr. Cote, 2012-12-06 Modern forest products research had its start hardly fifty years ago. Today we are in a position to apply the title wood science to the field of wood technology that is based on scientific investigation, theoretical as well as experimental. It is this research that fosters new uses for wood as a raw material and that creates the foundation for new industries for the manufacture of wood-base materials such as plywood, laminated products, particle and fiber board and sand wich construction. Wood technology in its broadest sense combines the disciplines of

wood anatomy, biology, chemistry, physics and mechanical technology. It is through this interdisciplinary approach that progress has been made in wood seasoning, wood preservation methods, wood machining, surfacing and gluing, and in the many other processes applied in its utilization. In 1936 the senior author published a book entitled, *Technologie des Holzes*, which was a first approach to a universal reference book on wood technology. The first edition of Volume I of the *Textbook of Wood Technology*, co-authored by H. P. BROWN, A. J. P. AN SHIN, and C. C. FORSAITH, was published in 1948. An indication of the rapid development of this field can be gained from the fact that the second edition of *Technologie des Holzes und der Holzwerkstoffe*, completely revised, was needed by 1951. It contains 2233 pages compared with the 764 pages of the 1936 edition.
