

fuzzy multiple attribute decision making

Fuzzy Multiple Attribute Decision Making: Navigating Complexity with Precision

fuzzy multiple attribute decision making is an advanced approach used to tackle complex decision problems where multiple criteria must be considered simultaneously, often under uncertainty or vagueness. Whether you're deciding on the best supplier for your business, selecting an ideal location for a new facility, or optimizing product design, this method helps you weigh different factors in a way that mimics human reasoning more closely than traditional crisp decision-making tools.

In many real-world situations, the information we work with isn't black and white. Ambiguities and subjective judgments play a significant role, which is where fuzzy logic and multiple attribute decision making (MADM) intersect powerfully. This article dives deep into what fuzzy multiple attribute decision making is, why it's important, and how it can be applied effectively in various fields.

Understanding the Basics of Fuzzy Multiple Attribute Decision Making

At its core, multiple attribute decision making involves evaluating and choosing among alternatives based on several attributes or criteria. Traditional MADM methods assume precise numerical inputs, but this isn't always reflective of reality. For example, when assessing the "quality" of a product, it's often subjective and can't be quantified exactly.

This is where fuzzy logic shines. Developed by Lotfi Zadeh in 1965, fuzzy logic allows for reasoning with imprecise or vague information. Instead of strict true or false values, fuzzy sets assign degrees of membership to elements, meaning something can partially belong to a category. Combining this with MADM leads to fuzzy multiple attribute decision making, which enables decision-makers to handle uncertainty effectively.

The Role of Fuzzy Sets in Decision Making

Fuzzy sets replace crisp evaluation criteria with linguistic variables like "high," "medium," or "low" that are mapped to numerical ranges using membership functions. For instance, a score of 7 out of 10 might belong to the "high" category with a membership degree of 0.8 but also to the "medium" category with 0.2. This nuanced representation captures the uncertainty or ambiguity inherent in human judgments.

Using fuzzy sets in MADM allows decision makers to express their preferences and perceptions more naturally. It also opens up opportunities to model complex systems where hard thresholds don't make sense, such as risk assessment, performance evaluation, or customer satisfaction analysis.

Key Techniques and Models in Fuzzy Multiple Attribute Decision Making

Over time, researchers have developed numerous methods for implementing fuzzy MADM, each with its strengths and applications. Understanding these methods can help you choose the most suitable one for your specific decision problem.

Fuzzy Analytic Hierarchy Process (FAHP)

One of the most popular approaches is the Fuzzy Analytic Hierarchy Process. FAHP combines the hierarchical structuring of decision criteria (from the classic AHP) with fuzzy logic to handle uncertainty in pairwise comparisons. Instead of fixed numerical ratios, decision-makers provide judgments using fuzzy numbers, which better represent subjective assessments.

The steps in FAHP typically involve:

1. Structuring the problem into a hierarchy of goals, criteria, and alternatives.
2. Performing pairwise comparisons with fuzzy scales (e.g., triangular fuzzy numbers).
3. Aggregating fuzzy judgments to compute weights for criteria.
4. Ranking alternatives based on their fuzzy scores.

FAHP is especially useful when expert opinions vary or when crisp data is unavailable.

Fuzzy TOPSIS

Another widespread method is Fuzzy Technique for Order Preference by Similarity to Ideal Solution (Fuzzy TOPSIS). It evaluates alternatives based on their distance from an ideal solution (the best possible) and a nadir solution (the worst possible), both expressed in fuzzy terms.

The general process includes:

- Constructing a fuzzy decision matrix for alternatives and criteria.
- Determining fuzzy positive ideal and negative ideal solutions.
- Calculating the distance of each alternative from these ideal points.
- Ranking alternatives according to their closeness coefficients.

Fuzzy TOPSIS handles conflicting criteria well and provides a clear ranking of choices.

Other Notable Methods

Beyond FAHP and Fuzzy TOPSIS, there are several other techniques like:

- Fuzzy VIKOR: Focuses on compromise solutions when criteria conflict.
- Fuzzy ELECTRE: Uses outranking relations in fuzzy environments.
- Fuzzy PROMETHEE: Provides a preference ranking based on pairwise comparisons.

Each offers unique advantages depending on the problem context.

Applications of Fuzzy Multiple Attribute Decision Making

The versatility of fuzzy MADM has led to its adoption across diverse industries and scenarios where uncertainty and multiple criteria coexist.

Supply Chain and Vendor Selection

Selecting suppliers is rarely straightforward. Factors like cost, quality, delivery time, and reliability need to be balanced, often with incomplete information. Fuzzy MADM methods accommodate subjective assessments and conflicting priorities, enabling companies to make more informed and flexible sourcing decisions.

Healthcare Decision Making

In medical diagnosis, treatment planning, and resource allocation, decision variables frequently involve ambiguity. Symptoms may be mild or severe, test results may be borderline, and patient preferences vary. Fuzzy multiple attribute decision making frameworks can integrate these nuances to support clinicians and administrators.

Environmental Management

Environmental issues often involve qualitative data and uncertain future conditions. When evaluating alternatives for pollution control, land use, or sustainability initiatives, fuzzy MADM helps policymakers weigh economic, ecological, and social factors holistically.

Engineering Design and Evaluation

Choosing the best design alternative requires consideration of performance, cost, safety, and maintainability. Fuzzy MADM techniques provide a structured way to incorporate expert judgments and imprecise measurements, leading to better engineering decisions.

Tips for Implementing Fuzzy Multiple Attribute Decision Making Effectively

While fuzzy MADM offers powerful tools, successful application requires thoughtful execution. Here are some tips to make the most out of these methods:

- **Clearly define criteria and alternatives:** Begin with a well-structured problem statement and a comprehensive list of attributes relevant to the decision.
- **Engage experts for fuzzy assessments:** Since fuzzy MADM relies on subjective inputs, collaborating with domain experts ensures meaningful membership functions and judgments.
- **Choose the right fuzzy MADM method:** Different methods suit different types of problems; evaluate the complexity, data availability, and decision context before selecting one.
- **Validate results through sensitivity analysis:** Test how changes in weights or membership functions affect the outcomes to ensure robustness.
- **Use software tools:** Implementations in MATLAB, Python, or specialized decision-making software can streamline calculations and visualizations.

The Future of Fuzzy Multiple Attribute Decision Making

As decision environments become increasingly complex and data-driven, fuzzy multiple attribute decision making continues to evolve. Integration with artificial intelligence, machine learning, and big data analytics promises even more nuanced and adaptive decision support systems. For instance, hybrid models that combine fuzzy logic with neural networks can learn from historical decisions and improve over time.

Moreover, the rise of uncertainty quantification and risk management in industries like finance and energy highlights the growing importance of fuzzy MADM. Decision-makers are looking for tools that not only handle multiple criteria but also embrace the inherent fuzziness of human judgment and real-world data.

Exploring these developments offers exciting opportunities for organizations seeking to enhance

their strategic and operational decisions.

Navigating the complexities of decision-making with multiple, often conflicting attributes can be daunting. Fuzzy multiple attribute decision making provides a flexible, intuitive framework that mirrors human reasoning under uncertainty, enabling better, more reliable choices in diverse domains. Whether you're a researcher, practitioner, or business leader, understanding and leveraging these techniques can make a significant difference in how you approach decision problems.

Frequently Asked Questions

What is fuzzy multiple attribute decision making (FMADM)?

Fuzzy multiple attribute decision making (FMADM) is a decision-making approach that incorporates fuzzy set theory to handle uncertainty and vagueness in evaluating multiple conflicting attributes or criteria, helping decision-makers to make more flexible and realistic choices.

How does FMADM differ from traditional multiple attribute decision making methods?

FMADM differs from traditional methods by integrating fuzzy logic, which allows for the use of linguistic variables and imprecise data, providing a better way to model human reasoning and uncertainty in the decision-making process.

What are common applications of fuzzy multiple attribute decision making?

Common applications of FMADM include supplier selection, risk assessment, project evaluation, environmental management, and healthcare decision-making, where decision criteria are often subjective and imprecise.

What are some popular techniques used in fuzzy multiple attribute decision making?

Popular techniques in FMADM include Fuzzy Analytic Hierarchy Process (FAHP), Fuzzy TOPSIS, Fuzzy VIKOR, and Fuzzy ELECTRE, each combining fuzzy logic with different ranking and evaluation methods to handle multiple criteria.

What are the benefits of using fuzzy multiple attribute decision making in business decisions?

The benefits include the ability to accommodate uncertainty and subjective judgments, improve the robustness of decisions, enhance flexibility in criteria evaluation, and better reflect real-world complexities compared to crisp decision-making approaches.

Additional Resources

Fuzzy Multiple Attribute Decision Making: Navigating Complexity with Precision

fuzzy multiple attribute decision making represents a sophisticated approach to decision-making processes where ambiguity and uncertainty play significant roles. Unlike traditional multiple attribute decision making (MADM) methods that rely on crisp, well-defined data inputs, fuzzy MADM integrates the principles of fuzzy logic to handle vagueness inherent in real-world scenarios. This paradigm shift is particularly crucial in fields where subjective judgments, imprecise information, or conflicting criteria are prevalent, enabling decision-makers to derive more nuanced and reliable conclusions.

Understanding Fuzzy Multiple Attribute Decision Making

At its core, fuzzy multiple attribute decision making is a methodology that combines fuzzy set theory with multiple attribute decision analysis. Multiple attribute decision making involves evaluating and prioritizing several competing alternatives based on multiple criteria or attributes. When these attributes or the evaluation data are uncertain or linguistically defined (such as “high,” “medium,” “low”), traditional crisp MADM techniques often fall short. This is where fuzzy MADM steps in, incorporating fuzzy numbers or fuzzy linguistic variables to better represent the uncertainty.

Fuzzy MADM’s ability to quantify imprecision makes it invaluable in domains like environmental management, supplier selection, risk assessment, and engineering design—where decisions are rarely black or white but shaded with degrees of uncertainty.

The Role of Fuzzy Logic in Decision Making

Fuzzy logic, introduced by Lotfi Zadeh in 1965, challenges the classical binary logic by allowing partial truth values between “completely true” and “completely false.” This flexibility is critical when decision criteria cannot be strictly quantified or when human judgment is expressed through qualitative assessments.

In fuzzy multiple attribute decision making, fuzzy logic is used to define membership functions that translate vague linguistic terms into mathematical representations. For example, the attribute “cost” could be categorized into fuzzy sets such as “low cost,” “medium cost,” and “high cost,” each with a membership degree that reflects the extent to which a particular alternative belongs to that set.

Key Techniques in Fuzzy Multiple Attribute Decision Making

Over the years, several techniques have been developed to operationalize fuzzy MADM. Each method offers distinct advantages depending on the decision context and data characteristics.

Fuzzy TOPSIS (Technique for Order Preference by Similarity to Ideal Solution)

Fuzzy TOPSIS extends the classical TOPSIS by considering fuzzy data inputs. The method ranks alternatives based on their closeness to a fuzzy ideal solution and distance from a fuzzy negative-ideal solution. This dual-distance measurement accounts for uncertainty in attribute evaluations and provides a robust ranking mechanism.

Fuzzy AHP (Analytic Hierarchy Process)

Fuzzy AHP incorporates fuzzy pairwise comparisons to capture the hesitancy and uncertainty of decision-makers. By using fuzzy numbers instead of crisp values, it enables more flexible weighting of criteria and more realistic prioritization of alternatives.

Fuzzy VIKOR (ViseKriterijumska Optimizacija I Kompromisno Resenje)

Fuzzy VIKOR focuses on ranking and selecting from alternatives with conflicting criteria, emphasizing compromise solutions. It is particularly useful when decision-makers seek a balance between the majority's benefit and individual regrets, all under uncertainty represented by fuzzy parameters.

Applications Across Industries

The adaptability of fuzzy multiple attribute decision making has led to widespread adoption across various sectors. Its proficiency in handling imprecise data makes it an attractive choice for complex decision environments.

- **Supply Chain Management:** Selecting suppliers often involves qualitative factors such as reliability, flexibility, and reputation. Fuzzy MADM allows companies to incorporate expert judgments and ambiguous data into supplier evaluation models.
- **Environmental Decision Making:** Environmental impact assessments require weighing multiple, often conflicting criteria with uncertain data. Fuzzy methods facilitate better handling of ecological risk, sustainability indices, and social acceptance factors.
- **Healthcare:** Treatment selection, diagnosis, and resource allocation benefit from fuzzy MADM frameworks that accommodate incomplete or subjective clinical data.
- **Engineering Design and Manufacturing:** Product design optimization and quality control processes frequently involve fuzzy attributes like aesthetic appeal or ergonomic comfort, which are difficult to quantify precisely.

Benefits and Challenges

The integration of fuzziness into MADM offers several distinct advantages:

- **Enhanced Realism:** Captures human reasoning more accurately by representing uncertainty and linguistic vagueness.
- **Flexibility:** Adapts to various types of data and decision scenarios without requiring precise numerical inputs.
- **Improved Decision Quality:** Facilitates nuanced trade-offs among criteria, leading to more balanced and satisfactory outcomes.

However, fuzzy MADM is not without challenges:

- **Computational Complexity:** Handling fuzzy data and calculating membership functions can increase the computational burden compared to crisp methods.
- **Subjectivity in Membership Functions:** Defining appropriate fuzzy sets and membership functions relies heavily on expert judgment, which can introduce bias.
- **Interpretation Difficulty:** The results, often expressed in fuzzy terms, may be harder for stakeholders unfamiliar with fuzzy logic to interpret and accept.

Comparative Perspectives: Fuzzy MADM Versus Traditional MADM

Comparing fuzzy multiple attribute decision making with classical MADM approaches highlights the trade-offs inherent in each framework. Traditional MADM methods such as Weighted Sum Model (WSM), Simple Additive Weighting (SAW), and the classical AHP assume precise data and deterministic criteria weights. While these methods are computationally efficient and straightforward, their inability to handle ambiguity limits their applicability in complex, real-world problems.

Fuzzy MADM, by contrast, embraces uncertainty, improving decision validity in uncertain environments. However, this comes at the cost of increased methodological complexity and the need for specialized knowledge in fuzzy mathematics. Decision-makers must weigh these factors when selecting an approach, considering the nature of their problem and the availability of precise data.

Future Trends and Innovations

As computational power and artificial intelligence technologies evolve, fuzzy multiple attribute decision making is poised to integrate more seamlessly with machine learning, big data analytics, and hybrid decision support systems. Emerging research focuses on automated fuzzy membership function generation, real-time fuzzy decision frameworks, and integration with probabilistic uncertainty models to enhance robustness.

Moreover, the rise of cloud-based decision platforms is making fuzzy MADM tools more accessible to practitioners, enabling collaborative and transparent decision-making processes across distributed teams.

Fuzzy multiple attribute decision making continues to redefine how organizations and individuals approach complex choices, offering a nuanced lens to navigate ambiguity and make informed, reliable decisions in an increasingly uncertain world.

Fuzzy Multiple Attribute Decision Making

fuzzy multiple attribute decision making: Fuzzy Multiple Attribute Decision Making

Shu-Jen Chen, Ching-Lai Hwang, 2012-12-06 This monograph is intended for an advanced undergraduate or graduate course as well as for researchers, who want a compilation of developments in this rapidly growing field of operations research. This is a sequel to our previous works: Multiple Objective Decision Making--Methods and Applications: A state-of-the-Art Survey (No.164 of the Lecture Notes); Multiple Attribute Decision Making--Methods and Applications: A State-of-the-Art Survey (No.186 of the Lecture Notes); and Group Decision Making under Multiple Criteria--Methods and Applications (No.281 of the Lecture Notes). In this monograph, the literature on methods of fuzzy Multiple Attribute Decision Making (MADM) has been reviewed thoroughly and critically, and classified systematically. This study provides readers with a capsule look into the existing methods, their characteristics, and applicability to the analysis of fuzzy MADM problems. The basic concepts and algorithms from the classical MADM methods have been used in the development of the fuzzy MADM methods. We give an overview of the classical MADM in Chapter II. Chapter III presents the basic concepts and mathematical operations of fuzzy set theory with simple numerical examples in a easy-to-read and easy-to-follow manner. Fuzzy MADM methods basically consist of two phases: (1) the aggregation of the performance scores with respect to all the attributes for each alternative, and (2) the rank ordering of the alternatives according to the aggregated scores.

fuzzy multiple attribute decision making: Fuzzy Multiple Attribute Decision Making Shu-Jen Chen, 1989

fuzzy multiple attribute decision making: *Multiple Attribute Decision Making* Gwo-Hshiung Tzeng, Jih-Jeng Huang, 2011-06-22 Decision makers are often faced with several conflicting alternatives. How do they evaluate trade-offs when there are more than three criteria? To help people make optimal decisions, scholars in the discipline of multiple criteria decision making (MCDM) continue to develop new methods for structuring preferences and determining the correct relative weights for criteria. A compilation of modern decision-making techniques, Multiple Attribute Decision Making: Methods and Applications focuses on the fuzzy set approach to multiple attribute decision making (MADM). Drawing on their experience, the authors bring together current methods and real-life applications of MADM techniques for decision analysis. They also propose a novel

hybrid MADM model that combines DEMATEL and analytic network process (ANP) with VIKOR procedures. The first part of the book focuses on the theory of each method and includes examples that can be calculated without a computer, providing a complete understanding of the procedures. Methods include the analytic hierarchy process (AHP), ANP, simple additive weighting method, ELECTRE, PROMETHEE, the gray relational model, fuzzy integral technique, rough sets, and the structural model. Integrating theory and practice, the second part of the book illustrates how methods can be used to solve real-world MADM problems. Applications covered in the book include: AHP to select planning and design services for a construction project TOPSIS and VIKOR to evaluate the best alternative-fuel vehicles for urban areas ELECTRE to solve network design problems in urban transportation planning PROMETEE to set priorities for the development of new energy systems, from solar thermal to hydrogen energy Fuzzy integrals to evaluate enterprise intranet web sites Rough sets to make decisions in insurance marketing Helping readers understand how to apply MADM techniques to their decision making, this book is suitable for undergraduate and graduate students as well as practitioners.

fuzzy multiple attribute decision making: Multiple Attribute Decision Making Ching-Lai Hwang, Kwangsun Yoon, 2012-12-06 This mono graph is intended for an advanced undergraduate or graduate course as well as for the researchers who want a compilation of developments in this rapidly growing field of operations research. This is a sequel to our previous work entitled Multiple Objective Decision Making--Methods and Applications: A State-of-the-Art Survey, (No. 164 of the Lecture Notes). The literature on methods and applications of Multiple Attribute Decision Making (MADM) has been reviewed and classified systematically. This study provides readers with a capsule look into the existing methods, their characteristics, and applicability to analysis of MADM problems. The basic MADM concepts are defined and a standard notation is introduced in Part 11. Also introduced are foundations such as models for MADM, transformation of attributes, fuzzy decision rules, and methods for assessing weight. A system of classifying seventeen major MADM methods is presented. These methods have been proposed by researchers in diversified disciplines; half of them are classical ones, but the other half have appeared recently. The basic concept, the computational procedure, and the characteristics of each of these methods are presented concisely in Part 11.1. The computational procedure of each method is illustrated by solving a simple numerical example. Part IV of the survey deals with the applications of these MADM methods.

fuzzy multiple attribute decision making: TOPSIS Strategy for Multi-Attribute Decision Making with Trapezoidal Neutrosophic Numbers Pranab Biswas, Surapati Pramanik, Bibhas C. Giri, Technique for Order Preference by Similarity to Ideal Solution (TOPSIS) is a popular strategy for Multi-Attribute Decision Making (MADM). In this paper, we extend the TOPSIS strategy of MADM problems in trapezoidal neutrosophic number environment.

fuzzy multiple attribute decision making: New Multiple Attribute Decision Making Method Based on DEMATEL and TOPSIS for Multi-Valued Interval Neutrosophic Sets Wei Yang, Yongfeng Pang, Interval neutrosophic fuzzy decision making is an important part of decision making under uncertainty, which is based on preference order.

fuzzy multiple attribute decision making: Multiple-Criteria Decision-Making (MCDM) Techniques for Business Processes Information Management Edmundas Kazimieras Zavadskas, Jurgita Antuchevičienė, Prasenjit Chatterjee, 2019-03-08 Information management is a common paradigm in modern decision-making. A wide range of decision-making techniques have been proposed in the literature to model complex business and engineering processes. In this Special Issue, 16 selected and peer-reviewed original research articles contribute to business information management in various current real-world problems by proposing crisp or uncertain multiple-criteria decision-making (MCDM) models and techniques, mostly including multi-attribute decision-making (MADM) approaches, in addition to a single paper proposing an interactive multi-objective decision-making (MODM) approach. Particular attention is devoted to information aggregation operators—65% of papers dealt with this item. The topics of this Special Issue gained attention in Europe and Asia. A total of 48 authors from seven countries contributed to this Issue.

The papers are mainly concentrated in three application areas: supplier selection and rational order allocation, the evaluation and selection of goods or facilities, and personnel selection/partner selection. A number of new approaches are proposed that are expected to attract great interest from the research community.

fuzzy multiple attribute decision making: Multiple attribute group decision making: A generic conceptual framework and a classification scheme Özgür Kabak , Bilal Ervural , The research activities in group decision making have dramatically increased over the last decade. In particular, the application of multiple attribute decision-making methods to group decision-making problems occupies a vast area in the related literature. However, there is no systematic classification scheme for these researches.

fuzzy multiple attribute decision making: Multiple Attribute Decision Making Gwo-Hshiung Tzeng, Jih-Jeng Huang, 2011-06-22 Decision makers are often faced with several conflicting alternatives. fuzzy multiple attribute decision making: Uncertain Multi-Attribute Decision Making Zeshui Xu, 2015-02-05 This book introduces methods for uncertain multi-attribute decision making including uncertain multi-attribute group decision making and their applications to supply chain management, investment decision making, personnel assessment, redesigning products, maintenance services, military system efficiency evaluation. Multi-attribute decision making, also known as multi-objective decision making with finite alternatives, is an important component of modern decision science. The theory and methods of multi-attribute decision making have been extensively applied in engineering, economics, management and military contexts, such as venture capital project evaluation, facility location, bidding, development ranking of industrial sectors and so on. Over the last few decades, great attention has been paid to research on multi-attribute decision making in uncertain settings, due to the increasing complexity and uncertainty of supposedly objective aspects and the fuzziness of human thought. This book can be used as a reference guide for researchers and practitioners working in e.g. the fields of operations research, information science, management science and engineering. It can also be used as a textbook for postgraduate and senior undergraduate students.

fuzzy multiple attribute decision making: Several Intuitionistic Fuzzy Multi-Attribute Decision Making Methods and Their Applications Zhinan Hao, Zeshui Xu, Hua Zhao, 2020-03-14 This book introduces readers to the latest advances in and approaches to intuitionistic

fuzzy decision-making methods. To do so, it explores a range of applications to practical decision-making problems, together with representative case studies. Examining a host of decision-making methods, most of which are based on intuitionistic fuzzy aggregation operators, its goal is to offer readers a new way to study decision-making methods in the intuitionistic fuzzy environment. Chiefly intended for practitioners and researchers working in the areas of risk management, decision-making under uncertainty, and operational research, the book can also be used as supplementary material for graduate and senior undergraduate courses in these areas.

fuzzy multiple attribute decision making: Neutrosophic Sets and Systems, vol. 14/2016 K Mondal, S. Pramanik, F. Smarandache, S. K. De, I. Beg, M. A. Malik, A. Hassan, S. Broumi, P. J. M. Vera, "Neutrosophic Sets and Systems" has been created for publications on advanced studies in neutrosophy, neutrosophic set, neutrosophic logic, neutrosophic probability, neutrosophic statistics that started in 1995 and their applications in any field, such as the neutrosophic structures developed in algebra, geometry, topology, etc.

fuzzy multiple attribute decision making: Neutrosophic Sets and Systems, Vol. VIII Florentin Smarandache, Mumtaz Ali, 2015-04-01 This volume is a collection of ten papers by contributors F. Smarandache, F. Yuhua, K. Mondal, S. Pramanik, S. Broumi, J. Ye, A. A. Salama, N. Easa, S. A. Elhafez, M. M. Lotfy, L. Kong, Y. Wu, P. Biswas, B. C. Giri, A. Mukkerjee, and S. Sarkar, focusing on a new kind of algebraic structures called (T, I, F)- Neutrosophic Structures; Expanding Uncertainty Principle to Certainty-Uncertainty Principles with Neutrosophy and Quad-stage Methods; Rough Neutrosophic Multi-Attribute Decision-Making Based on Rough Accuracy Score Function; an Extended TOPSIS Method for Multiple Attribute Decision Making based on Interval Neutrosophic Uncertain Linguistic Variable; Review of Recommender Systems Algorithms Utilized in Social Networks based e-Learning Systems & Neutrosophic System; Fault Diagnosis Method of Gasoline Engines Using the Cosine Similarity Measure of Neutrosophic Numbers; Cosine Similarity Measure Based Multi-attribute Decision-making with Trapezoidal Fuzzy Neutrosophic Numbers; Thesis-Antithesis-Neutrothesis, and Neutrosynthesis; Negating Four Color Theorem with Neutrosophy and Quadstage Method; and A new method of measuring similarity between two neutrosophic soft sets and its application in pattern recognition problems.

fuzzy multiple attribute decision making: Algebraic Structures of Neutrosophic Triplets, Neutrosophic Duplets, or Neutrosophic Multisets Florentin Smarandache, Xiaohong Zhang, Mumtaz Ali, 2019-04-04 Neutrosophy (1995) is a new branch of philosophy that studies triads of the form ($\langle A \rangle$, $\langle \text{neut}A \rangle$, $\langle \text{anti}A \rangle$), where $\langle A \rangle$ is an entity {i.e. element, concept, idea, theory, logical proposition, etc.}, $\langle \text{anti}A \rangle$ is the opposite of $\langle A \rangle$, while $\langle \text{neut}A \rangle$ is the neutral (or indeterminate) between them, i.e., neither $\langle A \rangle$ nor $\langle \text{anti}A \rangle$. Based on neutrosophy, the neutrosophic triplets were founded, which have a similar form (x , $\text{neut}(x)$, $\text{anti}(x)$), that satisfy several axioms, for each element x in a given set. This collective book presents original research papers by many neutrosophic researchers from around the world, that report on the state-of-the-art and recent advancements of neutrosophic triplets, neutrosophic duplets, neutrosophic multisets and their algebraic structures - that have been defined recently in 2016 but have gained interest from world researchers. Connections between classical algebraic structures and neutrosophic triplet / duplet / multiset structures are also studied. And numerous neutrosophic applications in various fields, such as: multi-criteria decision making, image segmentation, medical diagnosis, fault diagnosis, clustering data, neutrosophic probability, human resource management, strategic planning, forecasting model, multi-granulation, supplier selection problems, typhoon disaster evaluation, skin lesion detection, mining algorithm for big data analysis, etc.

fuzzy multiple attribute decision making: Algebraic Structures of Neutrosophic Triplets, Neutrosophic Duplets, or Neutrosophic Multisets, Volume II Florentin Smarandache, Xiaohong Zhang, Mumtaz Ali, Neutrosophy (1995) is a new branch of philosophy that studies triads of the form ($\langle A \rangle$, $\langle \text{neut}A \rangle$, $\langle \text{anti}A \rangle$), where $\langle A \rangle$ is an entity (i.e., element, concept, idea, theory, logical proposition, etc.), $\langle \text{anti}A \rangle$ is the opposite of $\langle A \rangle$, while $\langle \text{neut}A \rangle$ is the neutral (or indeterminate) between them, i.e., neither $\langle A \rangle$ nor $\langle \text{anti}A \rangle$. Based on neutrosophy, the neutrosophic triplets were

founded; they have a similar form: $(x, \text{neut}(x), \text{anti}(x))$, that satisfy some axioms, for each element x in a given set. This book contains the successful invited submissions to a special issue of *Symmetry*, reporting on state-of-the-art and recent advancements of neutrosophic triplets, neutrosophic duplets, neutrosophic multisets, and their algebraic structures—that have been defined recently in 2016, but have gained interest from world researchers, and several papers have been published in first rank international journals.

fuzzy multiple attribute decision making: *Neutrosophic Sets and Systems*, vol. 11/2016 N. Radwan, M. Badr Senousy, A. E. D. M. Riad, J. M. Jency, Chunfang Liu, YueSheng Luo, S. Pramanik, N. Shah, F. Smarandache, P. P. Dey, “Neutrosophic Sets and Systems” has been created for publications on advanced studies in neutrosophy, neutrosophic set, neutrosophic logic, neutrosophic probability, neutrosophic statistics that started in 1995 and their applications in any field, such as the neutrosophic structures developed in algebra, geometry, topology, etc.

fuzzy multiple attribute decision making: The Palgrave Handbook of Operations Research Saïd Salhi, John Boylan, 2022-07-07 Operations Research (OR) is a fast-evolving field, which is having a significant impact on its neighbouring disciplines of Business Analytics and Data Science, and on contemporary business and management practices. This handbook provides a comprehensive and cutting edge collection of studies in the area. Views differ on what should be included within the scope of OR. The editors of this volume have taken the view that an inclusive stance is the most helpful, both for theory and practice. Real-world problems often require consideration from both ‘softer’ and ‘harder’ perspectives and need consideration of both predictive and prescriptive problems. In accordance with this inclusive approach to OR, the book is divided into six parts, covering Discrete Optimization, Continuous Optimization, Heuristic Search Optimization, Forecasting, Simulation and Prediction, Problem Structuring and Behavioural OR, and finally some recent OR Applications. This wide-ranging handbook includes a culturally diverse collection of authors, with different perspectives and backgrounds around Operations Research. It will be of tremendous value to researchers, students and practitioners in the field of OR

fuzzy multiple attribute decision making: New Trends in Neutrosophic Theory and Applications Florentin Smarandache (editor), Surapati Pramanik (editor), 2016-11-05 Neutrosophic theory and applications have been expanding in all directions at an astonishing rate especially after the introduction the journal entitled “Neutrosophic Sets and Systems”. New theories, techniques, algorithms have been rapidly developed. One of the most striking trends in the neutrosophic theory is the hybridization of neutrosophic set with other potential sets such as rough set, bipolar set, soft set, hesitant fuzzy set, etc. The different hybrid structure such as rough neutrosophic set, single valued neutrosophic rough set, bipolar neutrosophic set, single valued neutrosophic hesitant fuzzy set, etc. are proposed in the literature in a short period of time. Neutrosophic set has been a very important tool in all various areas of data mining, decision making, e-learning, engineering, medicine, social science, and some more. The book “New Trends in Neutrosophic Theories and Applications” focuses on theories, methods, algorithms for decision making and also applications involving neutrosophic information. Some topics deal with data mining, decision making, e-learning, graph theory, medical diagnosis, probability theory, topology, and some more. 30 papers by 39 authors and coauthors.

fuzzy multiple attribute decision making: Electronic Engineering Dongxing Wang, 2018-07-27 The 4th International Conference of Electronic Engineering and Information Science 2017 (ICEEIS2017) was held January 7-8, 2017 in Haikou, P.R. China. This conference was sponsored by the Harbin University of Science and Technology, China. The conference continued the tradition of gathering world-class researchers, engineers and educators engaged in the fields of electronic engineering and information science to meet and present their latest activities. The proceedings contains contributions in the fields of Electronic Engineering, Information Science and Information Technologies, Computational Mathematics and Data Mining, Mechatronics, Control and Automation and Material Science and Technologies of Processing.

fuzzy multiple attribute decision making: Artificial Intelligence Logic and Applications

Yixiang Chen, Songmao Zhang, 2022-12-09 This book constitutes refereed proceedings of the 2nd International Conference on Artificial Intelligence Logic and Applications 2022 held in Shanghai, China from August 26–28, 2022. The 20 full papers presented in this volume were carefully reviewed and selected from a total of 27 submissions. The papers in the volume are organised according to the following topical headings: program logic; fuzzy logic; applications; author index.
