scienia mathematics physics chemistry biology and: Science Education: Models and Networking of Student Research Training Under 21 P. Csermely, K. Korlevic, K. Sulyok, 2007-04-11 It is essential to engage in scientific education of talented students as early as possible to develop the critical minds or scientific method judgments. There are multitudes of initiatives all around the world; and the number of these programs are steadily increasing. However, most of these initiatives are local programs connected to one or two motivated teachers or professors. They work in isolation, often struggling with the lack of resources and stay unrecognized to the general

public. This situation was a trigger to establish an international network, called the Network of Youth Excellence (NYEX) in 2004. The members of this network are organizations with a proven devotion to promoting scientific research among young students (i.e. under the age of 21). All member organizations delegate a representative to the Board, which is the main decision making body in important issues. The Board selects the Executive Board by entrusting a chairperson and two vice-chairs among themselves. The Executive Board is responsible for implementing causes, making everyday decisions and coordinating network activities.

scienzia mathematics physics chemistry biology and: Communication and Popularization of Science and Technology in China Fujun Ren, Jiequan Zhai, 2013-11-12 This book aims to be a reference for researchers studying the promotion of scientific literacy in China, as well as a guide for those interested in promoting scientific awareness. It covers advances in science and technology, communication and popularization practice, and research (STCP) both in China and abroad. Theoretical issues are discussed, and important problems in promoting scientific and technological awareness are identified (e.g.: basic principles, structures, channels of communication and current needs) This book provides a summary of the advances in STCP in China in recent years (especially after the issuing of the "National Scientific Literacy Outline") including STCP resource and capacity building, science popularization policies, practitioner development, infrastructure construction, and the development of the science popularization industry as a whole. At the same time, this book also reviews the design, organization, monitoring and evaluation of science and technology communication and popularization programs. It also highlights current STCP trends and developments in China and calls for a greater emphasis to be placed on research into promoting scientific literacy. It is hoped that this book will be useful to readers both in China and abroad by familiarizing them with the history and theory of STCP as well as its development over time. The 1st chapter briefly reviews the history of STCP. The 2nd through 5th chapters discuss the conceptual framework, basic structure, methods of communication, and current STCP needs. The 6th chapter introduces the principle content of programs aimed at improving Chinese citizens' scientific literacy, while the 7th and 8th chapters analyze the resources, capacities and conditions that have been developed for STCP in China. The 9th chapter investigates the organization, monitoring and evaluation of science popularization practices, and the final chapter summarizes important STCP topics and trends in contemporary China.
