Luiselli, 2025-07-21 In a world filled with hundreds of ASD treatments, it is crucial to distinguish between evidence-based practices and ineffective and potentially harmful pseudoscientific approaches. Interpreting ASD treatment research is complicated by differences in research norms across disciplines, competing theoretical underpinnings, and misleading information available from media sources. Overall, these issues contribute to a gap between the outcomes demonstrated in scientific studies and what is achieved in applied settings (e.g., schools, homes and clinics). Lifespan Treatment for Autistic Individuals guides professional practitioners in the selection of treatments that are procedurally and ethically best suited for their individual clients.

c ssrs training powerpoint: *Linguistic Biomarkers of Neurological, Cognitive, and Psychiatric Disorders: Verification, Analytical Validation, Clinical Validation, and Machine Learning* Ratree Wayland, Si Chen, Kevin Tang, 2024-08-07 Degeneration of nerve cells that control cognitive, speech, and language processes leading to linguistic impairments at various levels, from verbal utterances to individual speech sounds, could indicate signs of neurological, cognitive and psychiatric disorders such as Alzheimer's disease (AD), Parkinson's disease (PD), amyotrophic lateral sclerosis (ALS), dementias, depression, autism spectrum disorder, schizophrenia, etc. Currently, these disorders are diagnosed using specific clinical diagnostic criteria and neuropsychological examinations. However, speech-based biomarkers could potentially offer many advantages over current clinical standards. In addition to being objective and naturalistic, they can also be collected remotely with minimal instruction and time requirements. Furthermore, Machine Learning algorithms developed to build automated diagnostic models using linguistic features extracted from speech could aid diagnosis of patients with probable diseases from a group of normal population. To ensure that speech-based biomarkers are providing accurate measurement and can serve as effective clinical tools for detecting and monitoring disease, speech features extracted and analyzed must be systematically and rigorously evaluated. Different machine learning architectures trained to classify different types of disordered speech must also be rigorously tested and systematically compared.
